

What is claimed is:

1. A suspension arm mounting structure for attaching left and right suspension arms to a subframe which is mountable to a main frame of a vehicle body,
5 comprising:

a crossmember extending transversely of the subframe; and

left and right mounting parts for mounting the left and right suspension arms thereto,

the left and right mounting parts being integrally formed with left and
10 right end portions of the crossmember, respectively.

2. A mounting structure according to claim 1, wherein the subframe is formed into a substantially rectangular shape with left and right side frame members and front and rear crossmembers, and the crossmember is extending between
15 the left and right side frame members.

3. A suspension arm mounting structure for attaching left and right suspension arms to a frame of a vehicle body, comprising:

a crossmember provided on the frame and extending transversely of the
20 vehicle body;

left and right mounting members provided at the crossmember and extending downwardly from the crossmember for mounting the left and right suspension arms thereto; and

a connecting member for interconnecting the left and right mounting
25 members.

4. A mounting structure according to claim 4, wherein the connecting member

has a bottom surface located below a bottom surface of a member to be protected such as fuel tanks.
